**PREVENT WHITEFLY, THRIPS AND MORE**

Whitefly and thrips are two of the most challenging pests in ornamental production. There are multiple species of each, some of which can transmit plant viruses. Prevention is critical for controlling these insect pests.

Mainspring GNL insecticide is a powerful tool from the diamide class of chemistry (IRAC 28) that can be used to prevent whiteflies and thrips from establishing and reaching damaging levels in production. It can also shield crops from:

- Aphids
- Caterpillars
- Leafminers
- Leaf-feeding beetles
- Soft scales
- Lace bugs

Applying Mainspring GNL as a drench prior to pest build-up can provide over **10 weeks of systemic protection**.
